It discusses in detail the successes achieved using monoclonal antibodies (mAbs), including developments with regard to conjugated mAbs and also bispecific mAbs as novel treatment options for leukemia and solid tumors. It also examines the advances toward personalized immunotherapy, focusing on the effectiveness of adoptive cell therapy using genetically engineered T cells with tumor-associated antigen-specific T-cell receptors and chimeric antigen receptors, as well as the role of tailored vaccines based on the patient's cancer mutanome. Further, it describes the impressive therapeutic results recently achieved with checkpoint inhibitors, and analyzes novel strategies to modulate the immunosuppressive tumor microenvironment. Written by leading international experts and providing up-to-date information on emerging strategies, such as oncolytic virus-based therapy, epigenetic therapy, and combination therapy, the book appeals to all those with an interest in immunotherapy as it comes of age.
